

## PRESS RELEASE

Frankfurt, 17 February 2021

### **Lufthansa Group streamlines pilot training program within “ReNew” framework**

- **A modern framework, with a campus model and ab-initio training will be offered for cockpit crews of Lufthansa Group Airlines in the future**
- **Realigning structures, while maintaining the highest quality standards**
- **In Germany, the Bremen site will be further developed as a center of excellence for theoretical training modules, while practical training will be consolidated in Rostock-Laage**
- **Campus model could also enable current flight students to enter careers within Lufthansa Group Airlines at a later stage**

The global aviation crisis caused by the pandemic continues to have serious consequences for employees working in the airline industry. As a result, pilot training has also been severely affected by the repercussions of the crisis, as the need for recruitment has decreased.

Nevertheless, Lufthansa has decided to use the interruption caused by the crisis to fundamentally modernize the existing training concept at its in-house flight schools. The principle of ab-initio training will remain in place, as it has been proven to be successful for decades. However, in the future, a so-called “campus model” framework will provide modern, digital forms of training along with new selection procedures. These will enable more needs-based training for the various airlines of the Lufthansa Group and take into account the volatile demand in air traffic.

The campus training will be comparable to a university study program with defined qualification and training standards resulting in an institutionalized, internationally recognizable degree. After completing the training, graduates will be recruited depending on the demand situation of the respective flight operations of the various airlines of the Lufthansa Group.

Consequently, this gives the current generation of student pilots another perspective on a possible entry into cockpits at Lufthansa Group Airlines later on. In view of the current lack of prospects for pilot careers within the Lufthansa Group, last year the Group’s training division, Lufthansa Aviation Training (LAT), offered all

flight students the option of ending their training without incurring any costs or, alternatively, continuing their training at another flight school.

Part of the new training concept is to provide theoretical and practical training, which is located closer to the customer. In the future, the theoretical part will be concentrated at the traditional Bremen location, where the digital modules for theoretical pilot training will also be developed. The practical part of the training, which is scheduled to take place in Germany, will be consolidated at Rostock-Laage: LAT already operates a modern and recognized training facility at "RLG" airport, the site of its largest external customer.

Dr. Detlef Kayser, COO Lufthansa Group, says: "During the greatest crisis in global aviation, we have to put everything at the Lufthansa Group to the test, including our long-standing training concept for our pilots. Over the past decades, this has enabled us to set the highest and globally recognized quality standards in the selection and training for our cockpit crews. While maintaining these quality standards, we now want to modernize this proven concept, make it more efficient and reliable, and enter a new age with digital modules. Simultaneously, we are offering our current flight students a helping hand as the new criteria will give them the chance to find a job as a pilot for our airlines at a later date. The development of the new campus model is a prime example of how we are modernizing Lufthansa via our corporate program 'ReNew', by streamlining and improving structures to make them more efficient."
